Coronaviruses (CoV) are a large family of viruses that cause illnesses from common colds to more serious diseases such as Middle Eastern Respiratory Syndrome (MERS-CoV) and Severe Acute Respiratory Syndrome (SARS-CoV). The new coronavirus (nCoV) is a new strain that has not been previously identified in humans. The first case of coronavirus infection (COVID-19) was first reported from Wuhan, China, on 31 December 2019. So far, 67,107 cases of coronavirus have been detected worldwide in 29 countries. The number of deaths due to coronavirus is 1526, while 8365 people have recovered from the disease. Common symptoms of infection include respiratory symptoms, fever, cough, shortness of breath and difficulty breathing. In more severe cases, infection can cause pneumonia, severe acute respiratory syndrome, kidney failure, and even death. Standard recommendations to prevent the spread of infection include regular hand washing, covering the mouth and nose when coughing and sneezing, thorough cooking of meat and eggs. Avoid close contact with someone who shows signs of respiratory disease, such as coughing and sneezing. Who should get tested? Patient with a history of travel or stay in China during the last 14 days before the onset of symptoms; severe acute respiratory infection (fever, cough and requiring hospitalisation) A patient with any acute respiratory disease and at least one of the following symptoms for 14 days prior to onset of symptoms: (a) contact with a confirmed or probable case of COVID-19 infection) Worked or visited a medical facility where patients with confirmed or probable COVID-19 disease were treated. A particularly concerned person who wants to rule out infection with the new corona coronavirus (COVID-19), according to registered physician Chughtai Lab, offers a PCR test for coronavirus with results in 7 days. A sample is required: TamabThroat Swab Price: 7900 Source: World Health Organization and World Meters

Chughtai Lab offers a PCR test for coronavirus with results in 48 hours in Lahore and 72 hours in other cities. Contact us Suggestions for coronavirus mute 0311456789 Isolation instructions: Blood (3ml – precipitated) Detects antibodies against SARS-CoV-2 A positive antibody test means that the patient was previously infected at least two to three weeks before sampling Test for antibodies COVID-19 is recommended for the purpose of disease and pharmacovigilance. Test Performed With Fully Automated Chemiluminescence Using FDA Authorized Kits For More Information On Tests Or To Book Free Home Sample Collection Services Call Now | Whatsapp

Coronavirus is the name of the disease that is currently spreading around the world and raises great concern and fear among the general public. The scientific name is coronavirus disease COVID-19. In the past, a similar disease spread worldwide from the Middle East called Middle East Respiratory Syndrome (which became known during the Umra/Hajj pilgrimage period). The first case of coronavirus infection (COVID-19) was first reported from Wuhan, China, on 31 December 2019. So far, 67,107 cases of coronavirus have been detected worldwide in 29 countries. The number of deaths due to coronavirus is 1526, while 8365 people have recovered from the disease. Common symptoms of infection include respiratory symptoms, fever, cough, shortness of breath and difficulty breathing. In more severe cases, infection can cause pneumonia, severe acute respiratory syndrome, kidney failure, and even death. Standard recommendations to prevent the spread of infection include regular hand washing, covering the mouth and nose when coughing and sneezing, thorough cooking of meat and eggs. Avoid close contact with someone who shows signs of respiratory disease, such as coughing and sneezing. Fever, fatigue, and dry cough, aches and pains, nasal blockage, runny nose, sore throat and/or diarrhea – all these are usually mild and begin gradually. In fact, some people become infected, but they do not feel sick at all, and most people (about 80%) recover from the disease without the need for special treatment. Older people, and those who have underlying health problems such as high blood pressure, heart problems or diabetes, are more likely to develop serious illnesses. About 1 in 6 people can seriously get sick with breathing difficulties. Only 2% of people with this disease have died. Patient with a history of travel or stay in China during the last 14 days before the onset of symptoms; severe acute respiratory infection (fever, cough and requiring hospitalisation) A patient with any acute respiratory disease and at least one of the following symptoms for 14 days prior to onset of symptoms: Contact with a confirmed or probable case of COVID-19 infection. He worked or attended a medical facility where patients with confirmed or probable COVID-19 disease with acute respiratory disease were treated.
